

1. USBampel – a simple traffic light control

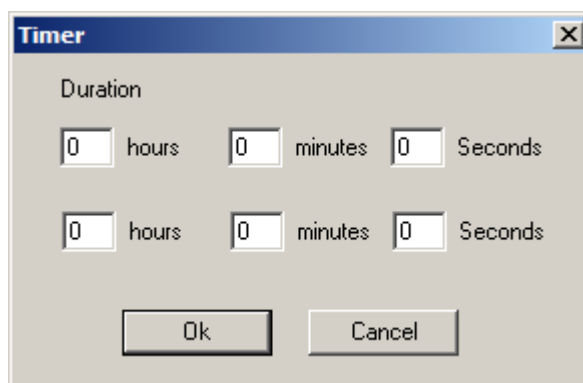

The application USBampel is a special version of the USBswitch program, specialized to control our USB traffic lights. All three lights are handled as a single device. When one light is turned on, the other two lights are automatically turned off.

The display and handling on the system tray is also simplified.

When using the timer, the traffic light device added a second timer. The upper line in the timer dialog defines the time to pass before the green light turns into yellow. The second line is the time definition from yellow to red.

It is possible to instruct the times when calling the program USBampel. The first argument defines the green phase and the second the yellow phase. After these times red is turned on and the program is terminated. Sample: USBampel 120 20

When the program is called without a physical device, a simulation starts to show the behavior.
